

What is Sandblasting? Local Experts Explain

Sandblasting is a surface preparation process commonly used before painting or powder coating to remove unwanted materials from surfaces such as rust, old paint, scale, or dirt. This technique involves directing abrasive particles at high pressure to clean or roughen surfaces for better coating adhesion.

Local experts at [Rustylions](https://rustylions.com), serving New Jersey, use state-of-the-art sandblasting equipment calibrated for different surface types and project sizes. Sandblasting is essential for restoring metal parts, preparing automotive components, and refurbishing architectural metals to extend lifespan and improve appearance.

Rustylions combines technical skill with precise control to ensure surfaces are treated without damage, optimizing results for powder coating and other finishing processes. Their knowledge of local environmental factors helps tailor sandblasting approaches for NJ's unique climate challenges.
